

YOUR LIGHTING CONTROLS ARE READY

Pre-Programming By

➤ How It Works

Shipping & Inventory

All materials ship to CSLA's Des Moines office for inventory. Any missing or incorrect parts are identified and corrected before they arrive on-site.

Sequence Verification

We verify the Sequence of Operations against contract documents and coordinate with the design team, contractors, and end users as needed.

Test & Verify

Devices are pre-programmed by room based on the approved sequence, bench-tested for functionality, and clearly marked with device IDs for accurate installation.

Kitting & Delivery

Components are labeled and packaged by room or area along with diagrams and instructions before being delivered to the jobsite.

Assist & Training

The CSLA Controls team supports you throughout the process. Final on-site adjustments and training are available as needed.

➤ Why Do It

Save time on-site! Your system will arrive custom-configured and packaged specifically for your project.

We take the time upfront to verify, test, and organize every device in your order so that by the time your system arrives, everything is accounted for and ready to go – helping you avoid delays, reduce troubleshooting, and stay on schedule.

A series of small steps that make a big impact on the success of your project.

➤ Project Qualifications

For standalone (non-networked) nLight wired systems with 200 or fewer devices.
